

Pipeline Repair/ Right-of-Way Work

At Great Excavations, our equipment is ideal for pipeline repair and right-of-way work in wet, swampy, muskeg areas.

Environmental Benefits:

- Our equipment greatly reduces the need to use expensive matting, which has an inherent risk of transporting plant species and potential disease from one place to the next. Unlike matting, which has numerous cracks and crevasses, our machines can be thoroughly cleaned between jobs.
- Our equipment is simple and efficient. It can be trucked in at the beginning of a job and trucked out at the end.
- Our extremely low ground pressure is hard to beat, meaning we have a comparatively small environmental footprint.

Whether we are working on an existing pipeline or a new one, our equipment can improve your project's efficiency and keep costs down. There is no need to build ice roads or use matting, except perhaps to build a work staging area at the site location.

Our pipe hauler can carry and crane two massive pipes or numerous small ones that would take two or more side booms to carry and maneuver around a site safely. The result? One piece of equipment doing twice the job. And that just makes good business sense.
